Description

Tabs used in the computer world are similar to the ones that we come across in our everyday life like the traditional card tabs or labels that are inserted in paper files and folders to group and categorize information relating to similar subjects together. Using the ProFusion Ultra IS application, you can now categorize your web page content by having them under various tabs which not only allows for easy reading for your website visitor but also eliminates the need to open different windows and waiting for them to load as you can easily switch between different tabs to read the

content inside them.

Finding the Module

The left side of the main administrative page is divided into various sections. Each section deals with a specific functionality of the Ultra IS application like Content,

Secure Users, Help, Webmaster, Advanced Features, etc. Tab Menus Manager is part of the Advanced Features of the ProFusion Ultra IS application.

Add Tabs Container

To organize your page content and categorize them into various groups, you need to have some tab containers created first. Tab containers are the placeholders for the various tabs that you see on your web page. With the ProFusion Ultra IS application, you can now have unlimited tab containers on your website and each tab container can have as many as 10 tab items inside them.

1. **Click** the [Tab Menus Manager](#) link under the Advanced Features section heading from the main admin page screen as shown in the previous figure.
2. You will now be presented with the Tab Container main page screen which is similar to the one shown here.

Home » List Tabs Container

[Add Tab Container]

PLEASE ADD TABS TO PROCEED.

<input type="checkbox"/>	TABS CONTAINER TITLE	VIEW/ADD TABS
No tab found.		

Legend
✓ Active Tabs Containers

3. Next **Click** the [\[Add Tab Container\]](#) link that is placed above the Tab Container Title heading bar. This action takes you to the Add / Edit Tabs page screen as shown here in this figure.
4. **Tab Name** – This is the name of the tab container that you are creating for your tabs. **Type** in a name inside the input box area. This name would not be displayed on your web page. It is provided for your easy reference. For this tutorial, let us name this as “Product Suite.”

Home » List Tab Container » Add / Edit Tabs

Tab Name	<input type="text" value="Product Suite"/>
Tab Size	<input type="text" value="800"/> x <input type="text" value="800"/>
* Width x Height * Maximum width 800 pixels.	
<input type="button" value="Add Tab"/> <input type="button" value="Cancel"/>	

5. **Tab Size** – This is the size in terms of width and height of your page content that would appear under the tabbed area. **Type** in the numbers to specify the width and height for your tab content area.

Note: The default width and height for the tab area that comes with the application are 800 x 800 pixels. This is ideal for placing the tabs inside the page content area. If your tab content exceeds the height limit specified herein, a scrollbar can be used to read it. Should you wish to have the tabs in an alternate area like inside the vertical column section, you need to adjust the width and height accordingly.

6. Click the **Add Tab** button placed at the bottom of the page to save your tab. You will now be taken to the List Tab Items page screen as shown below where you can start adding tab items and type in content for your tabs.

Home » List Tab Container » List Tab Items

You can add upto 10 tabs

Add Tab Items

After creating the tab container, the next step would be to create tab items and type in content for each item to be placed inside the tab container. You can have as many as 10 tab items inside each tab container.

1. Click the [\[Add Tabs Items\]](#) link as seen in the above figure.

- This action opens the Tab Menu Items page details screen like the one shown in the next figure prompting you to type in a title and content for your individual tab items. You can use all the standard basic page editor functions to create your tab content. You may even upload an image as we have done in this example. **Type** in the tab content inside the page editor area.

ProFusion Ultra Internet Solution Basic
UIS Basic is the perfect starter web application. Create your own home page and up to five main pages. Keep your page content current with our What-You-See-Is-What-You-Get (WYSIWYG) Word-like editor. The easy-to-use editor puts you in control of your website so you can be your own webmaster!. Keep your site looking fresh with unique header images on each page.

Background Color (Active State)

Text Color (Active State)

Background Color (Inactive State)

Text Color (Inactive State)

- You can select custom colors for your tabs below the editor page area. Options include background and text color of tabs when they are active (currently being viewed) or inactive (everything which is not currently being viewed).

As shown in figure A, You can set custom colors (shown in figure b) for both active (E-Commerce) and inactive (Pro,

Figure A

Association, and Mailer) tabs, and if custom colors are not set, the default colors will display (Basic).

Figure B

Background Color (Active State)		#FBCEBC		
Text Color (Active State)		#001B64		
Background Color (Inactive State)		#FEF5F2		
Text Color (Inactive State)		#6D92F5		
		<input type="button" value="Save"/>	<input type="button" value="Cancel"/>	

4. Enter a 6-digit color code or click on the color selector (🎨) to pick one of the available colors. After saving (see next step) and reloading the page, the bar to the right of the color selector will show the currently selected color. You must save the page before it will show a new color.
5. **Click** button to save the tab content edits. Now you have created 1 tab item out of the maximum 10. Repeat the above steps to create more tabs. When you are finished with the tabs, your List Tab page screen should look similar to the one shown here.
6. To reorder the tabs, **Click** on the red arrows ↑ ↓ to move them up or down until they are in the order you desire.

Activate Tab(s)

Legend
 ✓ Active Tabs

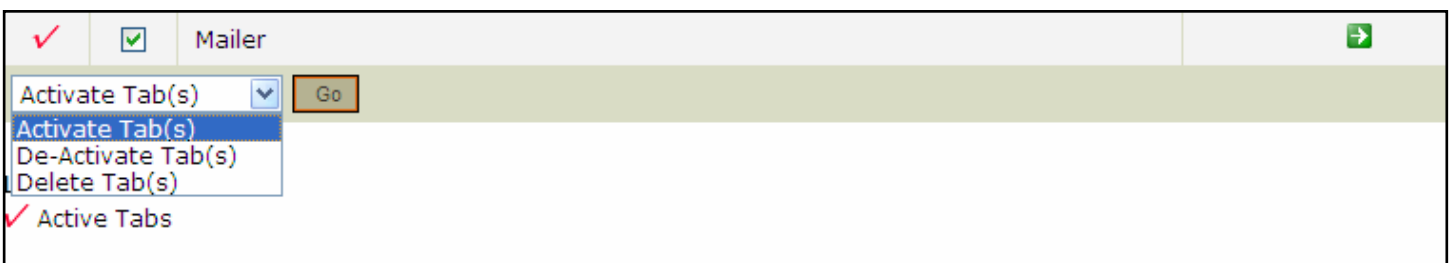

Note: This page lists all the tab items that are inside a specific tab container. You can edit the tabs and/or its content on this screen. The ✓ tick mark placed to the right of the each tab indicates its active status.

Edit Tabs

To edit a tab, **Click** the → arrow of the corresponding tab. This action opens up the Tab Menu Items details page screen like the one previously where you typed in the tab content. Save the edits once you are done with editing the tab content.

As an alternative, you may also de-activate a tab in which case, it would not display on your website but still would be there in the application to be used in the future should you need it. This is highly recommended to deleting a tab to save time and

effort of creating it from scratch once again should you need it at a later date.

To de-activate a tab, select the tab by **Clicking** inside the checkbox and **Click** the down arrow to select an option from the drop down menu. **Select** the **De-Activate Tab(s)** option and **Hit** the button. This action de-activates the selected tab and renders it inactive. You will also see that the ✓ tick mark that was there previously is absent now. To delete a tab altogether from the application, **Select** the tab and **Choose** the **Delete Tab(s)** option from the drop down menu. To activate the

tab once again, simply **Click** the **Activate Tab(s)** option which will automatically change its status to from inactive to an active on with the ✓ tick mark once again displaying next to it.

You can also modify your tab containers by following the same procedures, only this time you would be selecting the tab container instead of the tab items. Care should be taken while deleting or de-activating a tab container as this action not only affects the selected tab container but also the tab items inside it.

Place Tabs

Now that you have created tabs on the admin section, the next step would involve placing the tabs on your web page.

1. **Select** the page by **Clicking** on the corresponding page name link under the Content section heading on the left side of the main administrative page screen. In this case, we will select the “Home Pages” since we want the tabs to display

on the website's home page.

2. You will be presented with the Manage Home Page screen (as shown in the next figure) where you can modify your web page content.
3. **Position** the cursor inside the page editor area where you want to display the tab. Next **Select** the tab container that you want to use in this region from the "Tabs" drop down menu as shown in the next figure. This drop down menu lists all tab containers that are currently active in the system. This action places the selected tab onto your web page. In this example, we shall select the "Product Suite" tab container that we created earlier to display on the home page of our website.

4. After the tab is placed, you will now see something like [TPL_TAB_CONTAINER1] inside the page editor area where you had positioned the cursor previously. This command instructs the application to integrate the tabs on your web page.

5. Next **Click** the **Save** button to save the page edits.

You have now successfully created tabs and placed them on your web page. To access the frontend of your website, **Click** the [View Website](#) link placed next to your website name on top left hand corner of the admin page screen. The frontend of your website will open in a new web browser window.

What you see below is the home page of your website. You can see the previously created tabs displaying in the colored portion of the page content. Clicking on the various tabs automatically refreshes the tab content below it. While this refreshes the tab content, the web page content that is above and below the tabs will not change and would remain the same. You can read the content inside the tabs by simply clicking back and forth on them without having to refresh the entire page.
